RF-based Indoor Localization In Sensor Networks: Localization Using Signal Fingerprinting

Synopsis

In this book a Received Signal Strength (RSS) based indoor localization system, dubbed LEMON, based on low-cost low-power wireless devices is proposed, which offers better accuracy than the state-of-the-art. A simple RSS scaling trick is then used to further improve the accuracy of LEMON. Furthermore, we study the effect of the node orientation, the number and the arrangement of the infrastructure nodes and the profiled samples, leading us to further insights about what can be effective node placement and profiling. We also consider alternate formulations of the localization problem, as a Bayesian network model as well as formulated in a combinatorial fashion. Then performance of different localization methods is compared and again LEMON ensures better accuracy. An effective room localization algorithm is developed, and both single and multiple channels are used to test its performance. Furthermore, a set of two-step localization algorithms is designed to make the LEMON robust in the presence of noisy RSS and faulty device behavior.

Book Information

Paperback: 108 pages

Publisher: LAP LAMBERT Academic Publishing (August 31, 2012)

Language: English

ISBN-10: 3659223506

ISBN-13: 978-3659223501

Product Dimensions: 5.9 x 0.2 x 8.7 inches

Shipping Weight: 5.6 ounces (View shipping rates and policies)
